Sequence 101, Application US/08646360

Patent No. 58374DL

GENERAL INFORMATION:

APPLICANT: Better, Marc D.

APPLICANT: Studnika, Gary M.

TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating

TITLE OF INVENTION: Proteins

VOMESPONDENCE: 173

CORRESPONDENCE ADDRESS: ADDRESS: ADDRESSEE: McAndrews, Held & Malloy, Ltd.

STREET: 500 West Madison Street, 34th floor

CITY: Chicago

STATE: Illinois

COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Indels 0;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 100, Application US/08425336

Patent No. 5621083

GENERAL INFORMATION

APPLICANT: Carroll, Stephen F.

APPLICANT: Studnika, Gary M.

TITLE OF INVENTION: Immunicating Comprising Ribsome-Inactivating
TITLE OF INVENTION: Proceeding
NUMBER OF SEQUENCES: 140

CORRESPONDENCE MAISHALL O'Toole, Gerstein, Murray & Borun
STREBT: 6300 Sears Tower, 233 South Wacker Drive
                                                                                                                                                                                                                                    ö

The A chain is responsible for inhibiting protein synthesis through the catalytic inactivation of 60S ribosomal subunits by removing adenine from position 4,324 of 28S rRNA.
--- FUNCTION: The B chain is a galactose-specific lectin that facilitates the binding of nigrin b to the cell membrane that

"Momordin II, a ribosome inactivating protein from Momordica
balsamina, is homologome to other plant proteins.";
Nucleic Acids Res. 20:4662-462(1992).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
Type 1 RIP subfamily.
                                                                                                                                                                                                                                                                         62 SVAIDVTNVYVVAYRTRDVSYFFKESPPRAYNILFKGTRKITLPYTGNYENLQTAAHKIR

Sequence 2, Application US/08425336
Patent No. 5621083
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribsome-Inactivating TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 1400
CORRESPONDENCE ADDRESS: ADDRESSER: Marshall, O'Toole, Gerstein, Murray & Borun STREET: 6300 Sears Tower, 233 South Wacker Drive COUNTRY: ILLINGUS

ZIP: 60606-6402

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/425,336
FILING DATE: 18-APR-1995
CLASSIFICATION NUMBER: US/064,691
FILING DATE: 12-MAY-1993
APPLICATION NUMBER: US 07/901,707
FILING DATE: 19-JUN-1992
PRIOR APPLICATION NUMBER: US 07/901,707
FILING DATE: 19-JUN-1992
PRIOR APPLICATION NUMBER: US 07/787,567
FILING DATE: 04-NOV-1991
ATFORMEY/AGENT INPORMATION:
NAME: MAGNET PRIORS ADDRAL STREET: 630. CITY: Chicago US-08-425-336-2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 247, Application US/08621803
Patent No. 5851802
GENERAL INPORMATION:
GENERAL INPORMATION:
TITLE OF INVENTION: Methods for Recombinant Microbial Production of
TITLE OF INVENTION: Fusion Proteins and BPI-Derived Peptides
NUMBER OF SEQUENCES: 265
CORRESPONDENCE ADDRESS:
ADDRESSER: Marshall, O'Toole, Gerstein, Murray & Borun
STREET: 6300 Sears Tower, 233 South Wacker Drive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match 100.0%; Score 1287; DB 1; Length 251; Best Local Similarity 100.0%; Pred. - which Polynucleotide(s) encoding type I ribosome-inactivating proteins - are suitable for use as components of cytotoxic therapeutic agents.

Example 1; Fig 1; 221pp; English.

AAQ75532 encodes AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cytctoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

tumour and antiviral activity. Also described is a composition
comprising the isolated peptide or polypeptide, and a carrier, excipient
or auxiliary agent. Specifically claimed are MAP30 or GAP31 peptides or
polypeptides. The peptide or polypeptide is useful for treating HIV
infection, and tumour. This is the amino acid sequence of Gelonium anti-
HIV protein 30kDa (MAP30).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example

and/or possess reduced antigenicity. Such designer toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, skin, liver, breast, lymphoid, stomach, testicular, ovarian, pancreatic, bone, bone marrow, head and neck, cervical, osephagus, eye, gall bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthritis, inflammatory diseases, cardiovascular diseases, pathogenic diseases, and diabetes The method provides less antigenic proteins, peptides and polypeptides, which are more effective than prior art. The present sequence represents G. multiflorum recombinant gelonin (rGel)
                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  286

The invention relates to a composition comprising a conjugate of an antibody exhibiting binding specificity for an extracellular epitope of cers. Protein and a plant derived toxin, where the toxin is pharmacologically effective against neoplastic cells and is selected from gelonin, full length recombinant gelonin, functional gelonin fariammentical composition composition above and a pharmaceutical vehicle. For treating neoplastic diseases, e.g. human mammary carcinomas, human ovarian arcinomas, lung carcinomas, gastric tumors, salivary gland adenocarcinomas, or colon adenocarcinomas. The present sequence represents a scFv23-gelonin anno caid sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

The present invention relates to a method of generating a modified protein with reduced antigenicity while maintaining its biological activity. The method comprises identifying a region of the protein that is antigenic in a first subject using antiserum from either the first subject or a second subject of the same species as the first subject. In particular the invention discloses modified toxin compounds, for example gelonin toxin derived from Geloniuw multiflorum, that are truncated and/or possess reduced antigenicity. Such designar toxins have therapeutic, diagnostic, and preventative benefits, particularly as immunotoxins. The method of the invention is useful for generating proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, proteinaceous compounds with less antigenicity. The immunotoxin and gelonin toxin are useful for treating cancer, e.g. prostate, lung, brain, bone, bone marrow, head an neck, cervical, osophagus, eye, gall cancer, inventions of the invention are also useful for treating microbial bladder, kidney, adrenal glands, heart, colon, or blood cancer. The compositions of the invention are also useful for treating microbial pathogenesis, acquired immunodeficiency syndrome (AIDS), autoimmune diseases, hyperproliferative disorders including cancer, leukaemias, arthritis, inflammatory diseases, cardiovascular diseases, pathogenic diseases, hyperproliferative disorders including cancer, leukaemias, peptides and polypeptides, which are more effective than prior art. The present sequence represents murine single-chain ZME-018 antibody/G. multiflorum recombinant gelonin (rGel) (scfvMEL/rGel) fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

fusion protein and is suitable for introduction into a bacterial host.

The vector comprises: (a) DNA encoding at least one cationic

Corporations: (a) DNA encoding at least one cationic

Corporation and (c) DNA encoding an entire sequence represents the procein

Corated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents the procein

Croated between (a) and (b). The present sequence represents and hepstin,

Croated between (a) and (b). The peptides also bind to endotoxins and hepstin,

Croated between (a) and (b) are sexpressed in large amounts without

Significant proteolysis, and in some cases are actually secreted from the host cells. This allows the indirect production of anti-microbial BPI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GOLAEIAIDVTSVYVVGYQVRNRSYFFKDAPDAAYEGLFKNTIKTRLHFGGSYPSLEGEK 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant production of bactericidal/permeability increasing protein - by expression as a fusion protein in microbial host cells, then cleaving the BPI peptide from the carrier.
                                                                                                                                                                                       Bactericidal/permeability increasing peptide, BPI, fusion protein; bacterial infection; fungal infection; endotoxin; heparin; angiogenesis; fungicidal; recombinant DNA; vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          23 GLDTVSFSTKGATYITYVNFLNELRVKLKPEGNSHGIPLLRKKCDDPGKCFVLVALSNDN

The vector comprises: (a) DNA encoding at least one cationic

Carticotic statement (a) and (b) the encoding at least one cationic

Carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site

Carrier protein, and (c) DNA encoding an amino acid (aa) cleavage site

Carrier protein, and (b). The present sequence represents the protein

Crowned between (a) and (b). The present sequence represents the protein

Crowned between any uses including the treatment of bacterial and

Crowned infections. BPI peptides also bind to endotoxins and heparin,

neutralising their effects. The peptides have further been shown to

inhibit anglogenesis (partly due to heparin-binding activity). The fusion

proteins have been found to be expressed in large amounts without

significant proteolysis, and in some cases are actually secreted from the

host cells. This allows the indirect production of anti-microbial BPI

peptides in microbial hosts
